WEB CONSOLE · USER FLOW

Nightingale — Web Console User Flow

What this doc is: a step-by-step walkthrough of how a dispatcher or admin actually moves through the web console during a normal day — not just what each page contains, but the *order* they'd click through things in, and what happens on screen at each step.

§1

Who This Is For

The web console is used by **dispatchers and admins** sitting at a desk, coordinating the day's field work. This doc walks through the console the way one of them would actually use it — start to finish, one flow at a time.

§2

The Sidebar — Getting Around

Every page (other than Login) shares the same frame: a sidebar on the left for navigation, and a header up top showing the current page's title and a live clock.

	Page Title	[search]	12:41 PM
Dashboard			
Orders			
Route Plans			

Live Tracking	(page content)
Fleet	
Workers	

The sidebar order is intentional — it roughly mirrors the order a dispatcher touches things during a day: check the Dashboard, manage Orders, build Route Plans, keep an eye on Live Tracking, and check Fleet/Workers as reference.

§3 · Flow A

Sign In

[Login screen] → enter username + password → Dashboard

- 1 Open the app — if not signed in, you land on the **Login** screen.
- 2 Enter your username and password, submit.
- 3 On success, you're dropped straight onto the **Dashboard**.
- 4 On failure (wrong credentials), an inline error message appears and you stay on the login screen to try again.

§4 · Flow B

Morning Check-In (Dashboard)

The Dashboard is usually the first stop of the day — a quick read on where things stand before doing anything else.

Dashboard

- |
 - └ glance at: delivered / scheduled / available workers / order & plan statuses
 - |
 - └ click an Orders stat card → jumps to Orders page
 - └ click a Workers stat card → jumps to Workers page
 - └ click "New route plan" → jumps to the new-plan picker (Flow D)

- 1 Land on the Dashboard after login (or by clicking **Dashboard** in the sidebar anytime).
- 2 Read the top-line numbers: how many orders are done today, how many are scheduled, how many workers are available right now.
- 3 Scan the order-status breakdown (pending/assigned/in transit/delivered/failed) and the route-plan status breakdown (draft/optimizing/ready/dispatched/completed) for anything that needs attention.
- 4 From here, a dispatcher typically does one of two things next: jump

into **Orders** to add something new, or jump into **Route Plans** to build today's routes.

\$5 · Flow C

Add a New Order

This is the **only place in the console where something new gets typed in by hand** — every other page is for viewing existing data.

Orders page

└ view list, filter by status chip (All / Pending / Assigned / ...)

└ click "New order" → fill out the order form → submit → order appears in

- 1 Click **Orders** in the sidebar.
- 2 The page shows every order that exists, with filter chips across the top to narrow the list by status.
- 3 Click **New order** to open the order form.

- 4 Fill in the details: which customer, where the service happens, what skills are needed (nurse or technician, depending on the company), what day/time window it should happen in, and how long it'll take.
- 5 Submit — the new order appears in the list with status **pending**, and is now eligible to be picked up by a route plan for its scheduled day.

\$6 · Flow D

Build & Dispatch a Route Plan

This is the core workflow of the whole system — turning a set of pending orders into an actual, optimized plan, and sending it out to the field. It has several steps, each its own screen.

Route Plans (list)

|

└─ click "New route plan"

▼

New plan picker

|

pick orders (all from ONE day) → click "Optimize"

▼

Live solving view

```

| watch the optimizer work in real time (progress + a live-improving chart)
| waits here until the solve finishes
▼
Plan detail (the result)
| map of every driver's route + who's doing what + any unfitted orders
|
|— optionally open "Diagnostics" for the full report card
|
|— click "Approve" → plan is locked in and sent to workers' phones

```

- 1 Click **Route Plans** in the sidebar (or the Dashboard's **New route plan** shortcut).
- 2 The **plans list** shows every plan ever created — date, status, and a quick summary. Click **New route plan** to start one.
- 3 On the **picker** screen, select which orders to include. They must all share the same scheduled day — the picker will nudge you if you try to mix dates. Click **Optimize**.
- 4 You're taken to the **live solving view**. This shows the optimization engine (ALNS) working in real time: a stage tracker (loading → optimizing → saving → done) and a chart of the solution's quality improving as it searches. This typically takes well under a minute. You can simply wait here for it to finish.
- 5 Once done, you land on the **plan detail** page — the actual result:
 - 1 A map with every driver's route drawn out, color-coded, with a legend you can click to highlight one driver's path.
 - 2 Which worker is doing which job, in what order.
 - 3 A callout if any orders couldn't be scheduled, so nothing silently falls through the cracks.
- 6 Optionally, expand **Diagnostics** — a report card on how the optimizer performed (how long it took, how much better the plan got, a cost breakdown, which strategies it used most). Useful if you're curious *why* the plan came out the way it did; not something you need to check every time.

7

When the plan looks good, click **Approve**. This locks the plan in, marks its orders as assigned, and sends a job notification to each assigned worker's phone — this is the moment the plan actually reaches the field.

Watch the Field Live (Tracking)

Once workers are out and have started their shifts on the mobile app, a dispatcher can watch them move in real time.

Live Tracking

- |
- | map shows a dot per worker/vehicle currently reporting location
- | click a dot / list entry → overlay card with that person's details
- | availability roster → who's available / unavailable, and why

- 1 Click **Live Tracking** in the sidebar.
- 2 The map shows a live-updating dot for every worker and vehicle currently sending GPS pings (this only happens once a worker has tapped **Start Shift** on their phone).
- 3 Dots that haven't updated in a while are visually flagged as **stale**, so a dispatcher can tell the difference between "just went quiet for a second" and "hasn't reported in a long time."
- 4 Click a dot or an entry in the side list to see that person's details in an overlay card.
- 5 Below the map, an **availability roster** shows every worker's current available/unavailable status — including the reason, if the worker provided one when they toggled themselves unavailable on the app.

§8 • Flow F

Look Up Fleet or Worker Info

These two pages are reference-only — nothing is created or edited here, they're just for looking things up.

Fleet

- └ tabs: Vehicles / Drivers / Depots
- └ click a tab to switch table

Workers

- └ card grid of nurses/technicians
- └ shows skills, status, shift, contact

- 1 Click **Fleet** to see three tabbed tables: **Vehicles**, **Drivers**, and **Depots**. Switch tabs to see each list.
- 2 Click **Workers** to see a card grid of field staff, showing each person's skills, current status, shift hours, and contact info. A worker marked unavailable shows their reason right on the card.

\$9

Putting It All Together (A Full Day)

A realistic end-to-end sequence, stitching every flow above into one day:

1	Sign in	Flow A
2	Check the Dashboard for an overview	Flow B
3	Add any new orders that came in overnight	Flow C
4	Build today's route plan from the pending orders	Flow D
5	Review the optimized result, approve, dispatch	Flow D
6	Watch workers move on Live Tracking through the day	Flow E
7	Look up a vehicle or worker's details as questions come up	Flow F
